

High Performance Building Envelope

Steven Tratt

WTI/ CANAM Building Envelope Specialists

High Performance Building Envelope

This session is designed for building/property/facility managers, building owners, developers, architects and other design and construction professionals interested in increasing their knowledge of the application and use of air barriers in the building envelopes of commercial and multi-family residential buildings. Researchers, architects and code writers have shown that attention to specific details in both new and retrofitted envelopes result in better performing buildings with better comfort and long durability as well as lower energy consumption. Air leakage through the building envelope is silent, invisible and cunning. It causes numerous building envelope problems including wetting of cavity materials, spalling of masonry, premature corrosion of metals, blistering of paint, icicles, staining of contraction. Continuity is important, but strength is even more important. In buildings, the air barrier system must be designed, and specified on plans. It has specific performance criteria and specific material requirements.

Steven Tratt

WTI / Canam Building Envelope Specialists, Beachwood, OH Steven Tratt, National Sales Manager, Lead Assessor-Steve has over 30 years of experience in the building envelope air barrier industry as well as the insulation and thermal barrier industry, including expertise in air leakage testing and weatherization materials. He has worked extensively in the custom design of building science solutions for the education, healthcare, commercial, Multi-family, and government markets. He was on the taskforce that wrote the US Army Corps of Engineers Air Leakage Test Protocol for Building Envelopes. He has trained building envelope retrofit contractors in Canada, USA, Ireland, England, and Australia and has made numerous presentations to a wide variety of trade associations. Currently he has been involved in organizing and presenting air barrier seminars for architects, engineers, building owners and facility managers throughout Canada and the United States.

His certifications and qualifications include, Construction Management (NAIT), BPI Certified Building Analyst Professional and Building Envelope Professional, A/D Fire barrier Certified, CMHC Mold Remediation Certified, Six Sigma Certified, Member of CUFCA (Canadian Urethane Foam Contractors Association), Member of ABAA (Air Barrier Association of America).

Learning Objectives

- 1. How better building envelope can reduce energy demand on heating and cooling and reduce energy.
- 2. The significance of each part of the building envelope (top, bottom, vertical shafts and the walls) relative to the efficient operation.
- 3. Identifies problems that can occur with the lack of compartmentalization and/or decoupling between floors in buildings over 3 stories.
- 4. Learn how a better building envelope can reduce energy demand on heating and cooling and reduce energy.

Definition of the High Performance Building

The term "**high performance building**" means a building that *integrates and optimizes* all major high-performance building attributes, including <u>energy efficiency</u>, <u>durability</u>, <u>life-cycle</u> <u>performance</u>, and <u>occupant productivity</u>.*

*High Performance Building Council *a council of the National Institute of Building Sciences*

4 Elements of a High Performance Building:

- Heat Flow = Comfort
- Air Flow = Air Pressure
- Moisture = RH
- Air Quality = IAQ

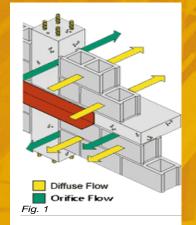

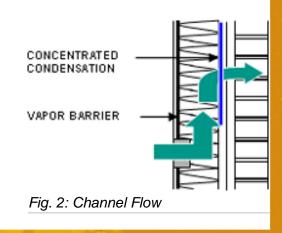

Air Barrier Continuity - Identifying breaches : The Basics of Air leakage

Continuity is the most important characteristic of the air barrier system. It functions to prevent ...

Infiltration / Exfiltration which is caused by:

- •Diffusion Flow
- •Orifice Flow
- •Channel Flow

 Air Barrier Continuity allows the proper control of air movement into and out of building enclosures

All six sides of a building enclosure must be continuous within themselves and in conjunction with each other

Air Leakage & Moisture

Test simulating a Ottawa, Canada winter comparing an intact air barrier vs. a ¾" hole in the air barrier

(~ 8 Gallons)

100 times more moisture diffused through the board!

Building Air Leakage Consequences

The Air and Moisture Connection – The Building as a SYSTEM

Basic Diagnostic Tools: For the forensic field assessor – Identifying the source

Trained Assessor with camera, floor plans and intake form or Air Leakage Data Collection APP

Smoke Pencil or similar tool to Provide show of air flow

Flir E50 BX

IR camera

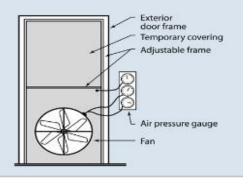

Velocicalc 9565 IAQ Probe 980 for: Temp – RH CO_2 – Pressure Mold and BIO snaps

Advanced Diagnostic Tools: Optional cost, additional set-up – Measures leakage

Diagnostic Tools

Testing the airtightness of a home using a special fan called a blower door can help to ensure that air sealing work is effective. Often, energy efficiency incentive programs, such as the DOE/ EPA ENERGY STAR Program, require a blower door test (usually performed in less than an hour) to confirm the tightness of the house.

Blower Door

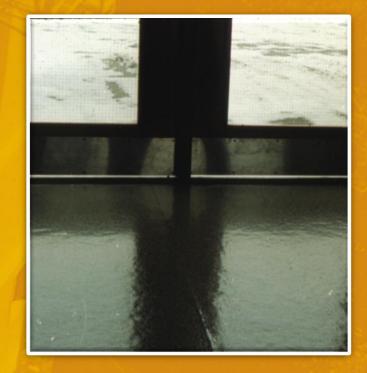

Standard Pressurization Kit and gauges used by Building Science Engineer Partner

Multi-fan or larger

Failure of air barrier systems

•Breaches in the air barrier and its connections/continuity will make buildings:

- Less healthy
- •Unsafe
- •Less durable
- Uncomfortable
- •Less Energy Efficient

Failure of air barrier systems

•Leads to:

•Uncontrolled and Uncontrollable Air Leakage •Infiltration / Exfiltration

•Caused by:

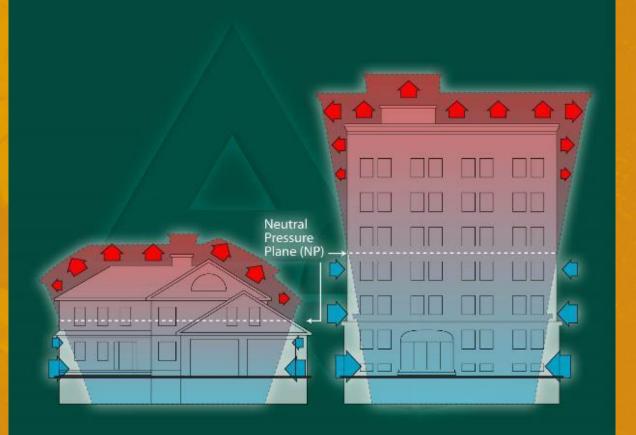

•<u>Stack effect</u> •<u>Wind effect</u> •<u>Mechanical effect</u>

The Building Science of Air Barrier Continuity

Failure of air barrier systems

Stack effect is a temperature-driven phenomenon which is especially noticeable in cold weather when warmer indoor air, which is more buoyant than the colder outdoor air, tends to rise in the building.

The Building Science of Air Barrier Continuity

Failure of air barrier systems

Wind Effect is a weather-driven phenomenon which is especially noticeable in regions with seasonal temperature fluctuations.

The Building Science of Air Barrier Continuity Failure of air barrier systems

Mechanical Effect (Negative) Neutral Pressure Plane (NP)

EDUCATION IN THE REAL PROPERTY OF THE REAL PROPERTY

Negative Mechanical Effect is an HVAC-driven phenomenon in which the building HVAC exhausts air causing an internal negative pressure that promotes air infiltration.

The Building Science of Air Barrier Continuity Failure of air barrier systems

Mechanical Effect (Positive) JIL I Neutral Pressure Plane (NP)

Positive Mechanical Effect is an HVAC-driven phenomenon in which the building HVAC draws in enough air to create an internal positive pressure that promotes air exfiltration.

The byproduct / financial benefit of air sealing: Is a cost justifiable process, not a sole driver

- Energy Efficiency that will save you MONEY!
 More efficient ventilation in the HVAC system
 More efficient use of pumps and fans within the system
 - •Better performance of the system could mean longer operation life of the equipment
- 3 recommendations for all buildings (in order)
 - •Air Sealing Inexpensive. Is a building maintenance issue that is often ignored. Should be looked at as long-term investment.
 - •Insulate ALWAYS done <u>after</u> air sealing to enhance the conditioned space.
 - •HVAC upgrade / redesign. Done in this order will maximizes system efficiency.

How to Implement??

There is a process for Air Leakage Assessment

Fixing and preventing air leakage paths

Steps required for BE Air Leakage Remediation:

- Conduct building assessment
- Determine location and severity of air leakage pathways
- Identify external / internal pathways
- Develop scope of work to create air barrier continuity

Air Barrier Continuity Diagnosing the problems

Building Envelope Assessments:

Locating air leakage paths

Pressurization testing

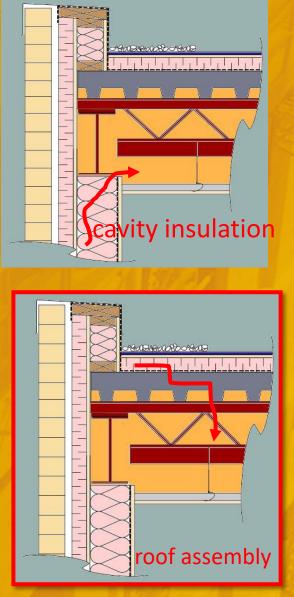

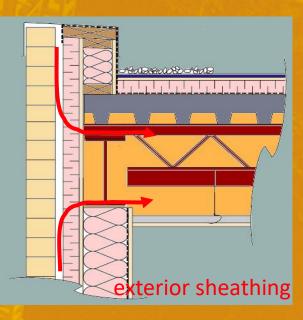

Infrared thermography

Smoke Puffer (Pencil)

The plenum Air moves through many different assemblies if air barrier systems are not in place

Seal top of building

Roof/wall intersections and plenum spaces

Mechanical penthouse doors and walls

Other roof penetrations

HVAC equipment

Seal bottom of building

Defined as: the "ground floor" and anything below grade

- Typically a unique area of the building. Examples include:
- Soffits and ground floor access doors
- Underground parking access doors
- Exhaust and air intake vents
- Pipe, duct, cable and other service penetrations into core of building
- Sprinkler hangar penetrations, inspection hatches and other holes
- Seal wall to floor slab
- Residential crawl spaces

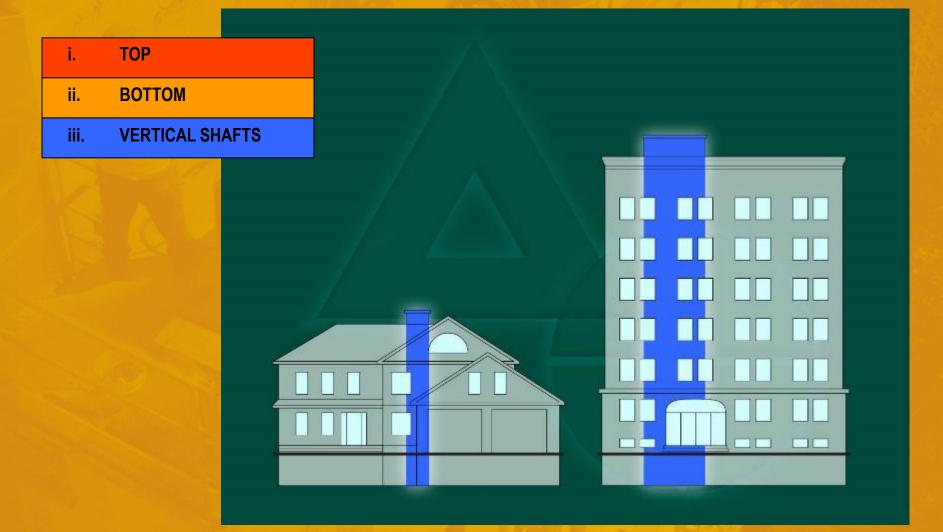

THIC DOOD

Seal vertical shafts

Examples include: •Stairwell fire doors

•Fire hose cabinets

•Plumbing, electrical, cable and other penetrations within service rooms

•Elevator rooms – cable holes, cable holes, bus bar openings

Seal vertical shafts Other examples include: •Garbage chute perimeter and access hatches

 Pipe penetrations and escutcheons in restrooms/bathrooms of multi-story buildings

•Smoke shaft access doors, Elevator shaft smoke control grills and service shafts

Seal outside walls and openings Examples include:

- Weather-strip windows, doors, including balcony/patio doors and seal window trim
- Exhaust fans and ducting
- All service penetrations
- Baseboard heaters
- Electrical receptacles
- Baseboards

V. COMPARTMENTALIZE

Compartmentalization is necessary for any area that is either part-time or full-time vented and which should not be included within the building envelope air barrier.

Air Barrier Continuity Compartmentalize Examples of areas that need to be

compartmentalized:

- •Garages
- Vented mechanical rooms
- Garbage compactor room
 Emergency generator room
- High voltage rooms
 Shipping docks
 Elevator rooms
 Workshops

>It is important to compartmentalize these areas to provide fire safety, odor and pest control, not to mention energy savings and to reduce GHG emissions measured in MT CO_2 .

Materials used

2-component polyurethane foam insulating air seal kits Must meet requirement of ULC Standard S711.1

Materials used

Caulking - Silicones

DAP Silicone Doors and Windows

Materials used

Door and window weather-stripping seals

Materials used

Markets Served

- Education
- Healthcare
- Commercial
- Industrial
- Multi-unit Residential
- Private & Public Sectors
- Rec Centers/Arenas
- Federal/Military

Metrics:

2022 Projected Savings:

Air Barrier Upgrades result in average annual energy savings (heating/cooling) of \$0.097/SF/year

i.e.: 1,000,000 SF x \$0.10 = \$100,000/year in energy savings

\$100,000 x 5 years = \$500,000 available capital to help fund building maintenance projects such as roofing.

Air Barrier Remediation Project Financial Analysis

Issue: Medical Office Building, Comfort issues, Insects, High energy costs

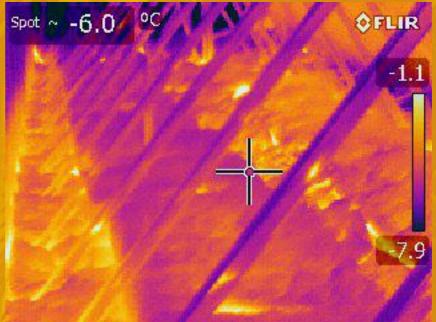

Knee wall attic

Knee wall attic, many holes in roof deck below attic space. Condensation issues

Window Trim- signs of insect migration

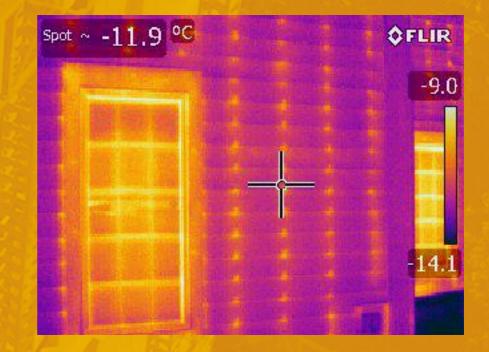

Exterior Façade Issues-Thermal bridging

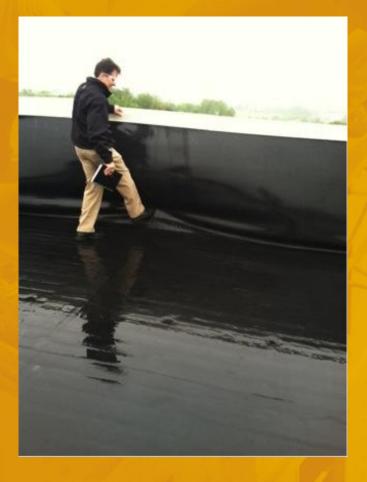

Medical Office Bldg Case Study #1

Results 24,000 sq ft Cost to rectify \$86,827 Hole size sealed 12 sq ft.

- Annual Savings \$ 8,247
- Over \$0.35/ sq ft/ year
- Years Payback 10.5 years
- No more insect migration
- Increased occupant comfort

Issue: Manufacturing Company with pressure blowing roof into roof flashings causing failure

Results: Project coordinated with Roofing contractor to install metal wall panels and remediate air leakage at Roof Wall connection.

Results: Air leakage controlled, providing enhanced; durability, life cycle of roof wall, energy efficiency benefit and overall better appearance.

Homer Louisiana Hospital Air Sealing Project: History of Mold Problems, High Humidity and Condensation, Negative Air Pressure, High Bills

Case Study #3 – Effects of Air Leakage in a Humid Environment

Case Study #3 – Effects of Air Leakage in a Humid Environment

Overhanging Soffit Roof/Wall Joint Leakage Site Seen From Inside Unconditioned Soffit

3. 16. 2005

Overhanging Soffit Roof/Wall Joint Leakage Site Seen From Inside Conditioned Space

Case Study #3 – Effects of Air Leakage in a Humid Environment

Opening exposed to outside overhang, Repaired with Foamboard and sealant 04.26.2005 13:04

Metal soffit panel seams, sealed with foam sealant

Case Study #3 – Effects of Air Leakage in a Humid Environment

Results: Controlled Humidity, Twice Expected Savings on Utility Bills, 3 year payback on \$52,000 job

Improving health, safety, durability, comfort and energy efficiency in healthcare, commercial, institutional and multi-family buildings is as easy as **ABC**

(Air Barrier Continuity)
